

SSL VPN and Web Portal with 2 Factor Authentication

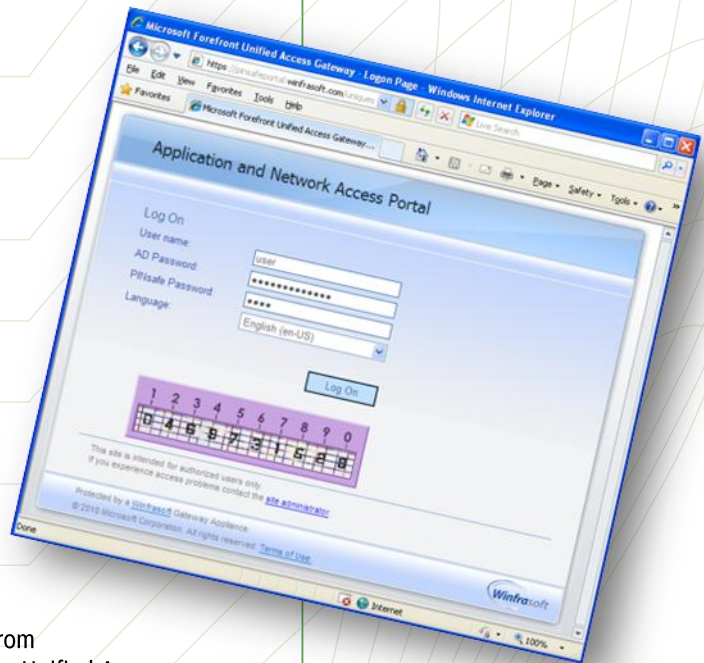

Simple and secure remote access to all my applications from anywhere with a One Time Code.

The Winfrasoft Gateway Appliance enables organisations to access resources on their corporate network from any location, using a variety of devices, while remaining confident that it will be done in a safe and secure manner.

By utilising a combination of connectivity options, ranging from SSL VPN to DirectAccess, as well as built in rules and policies, Unified Access Gateway (UAG) provides centralised and easy management of an organisation's complete anywhere access offering.

The pre-integrated Swivel PINsafe One Time Code solution adds a strong 2FA authentication layer to UAG via SMS/TEXT messages or a phone application to reduce the costs of traditional tokens. The Turing 1 ½ factor system is even simpler to deploy and provides much greater security than passwords alone. The tight integration with UAG caters for single box or multi box deployment scenarios, as well as easy Active Directory setup.

Winfrasoft

SSL VPN and Web Portal with 2 Factor Authentication

Gain access to a specific network by using different types of end-point devices such as kiosks, PCs, and mobile devices, via a standard web browser over a secure SSL-VPN tunnel. Remote client access is secured by an integrated network perimeter defence system and users are strongly authenticated using a One Time Code. Microsoft Forefront UAG 2010 is the recommended platform for securing SharePoint and Exchange.

Winfrasoft UAG with PINsafe provides...

Flexibility

Secure, browser-based access to corporate applications and data from more locations and more devices with 1 ½ or 2 Factor authentication options.

Integrated Security and Asset Protection

Integrated application protection and PIN authentication engine helps ensure the integrity and safety of network and application infrastructure by blocking malicious traffic and attacks.

Simplified Management

Comprehensive policy enforcement helps drive compliance with legal and business guidelines which require information usage criteria to limit exposure and liability when accessing sensitive corporate data.

Swivel PINsafe with Forefront UAG

PINsafe's single channel web-based solutions are ideal for protecting UAG portal pages publishing, Outlook Web Access (OWA) and SSL VPNs. It is a simple to use and effective alternative, or addition, to vulnerable username and password authentication.

The core of the solution is the Swivel one-time code (OTC) extraction protocol whereby a user is sent a security string, the user then combines this security string with their PIN number to derive a one-time code. They then use this one-time code to authenticate themselves.

Delivery

Available on the TIER-1 platform of choice.
